DROP cluster

- Drop is:
    - With 7 nodes at 8 cores each, DROP is designed for non-interactive queue-based parallel supercomputing.
- Drop is not:
    - For anything that is interactive, uses less than 8 parallel cores per job, is not queue-able, or generally takes less than a few nights to run on your desktop, you had better use one of the stand-alone servers.
    - Drop has only scratch storage. Move important data to a different server. Anything on /data/ can be deleted without notice.
    - Kindly note that this cluster comes 'as is' with no support from IT, Joeri or Jason.

- Come see Joeri for an account
- File systems
    - /export/home/<user>
        - RAID6, 20GB/user quota
    - /data (crossmounted over all nodes) = RAID0, unlimited space
        - RAID0, 5TB, no quotas
        - heaviest users will have older data auto-deleted by semi-random script, so better clear it out yourself
