University of Durham (UK), University of Padua (Italy)

# Part 1

## Introduction

# Part 1: What are rotation curves?

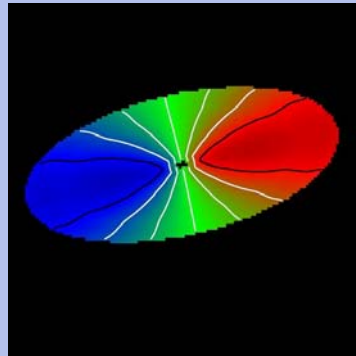

Pizzella et al. (2004)

Rotation velocity of gas and/or stars as a function of radius

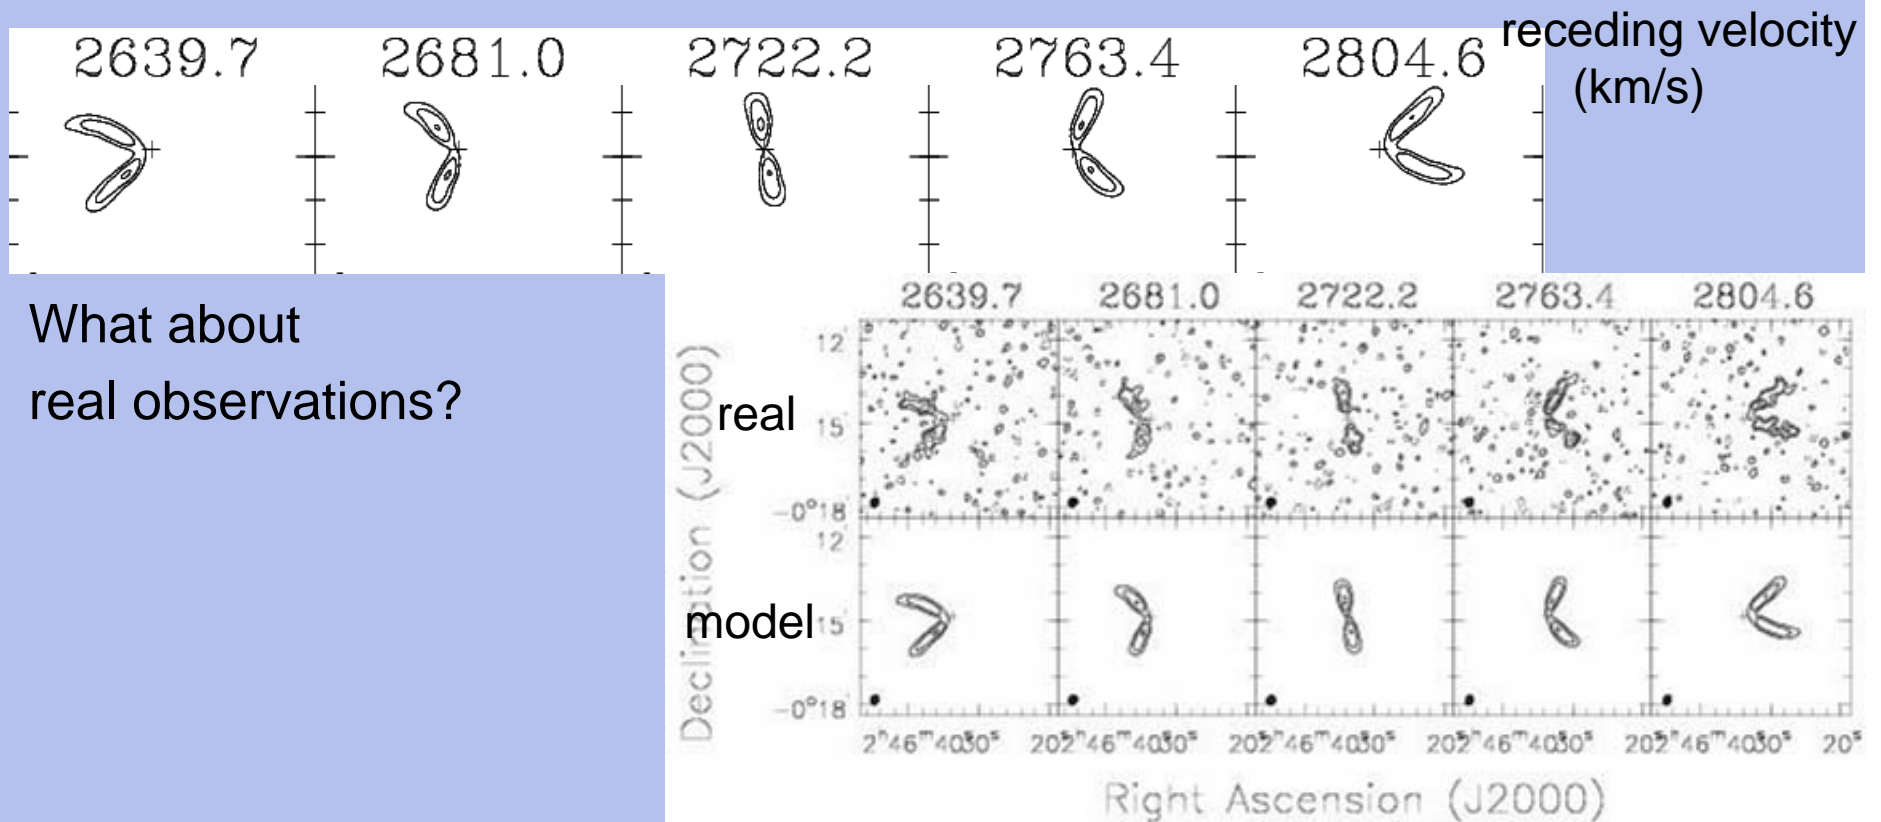

$V_{\text{rot}}(r)$ : traced via different lines:  $\text{H}\alpha$ , HI, CO, ...

# Part 1: rotation curves from HI data

Rotating disk:

Data cube (series of maps @ slightly different freq.) should look like this:

What about  
real observations?

# Part 2

NGC 3741:

The most extended rotation curve  
ever

# Part 2: NGC 3741

(Gentile, Salucci, Klein, Granato, 2007, MNRAS, 375, 199)

greyscale: optical

contours: total HI (neutral hydrogen)

2 x 12h WSRT observations

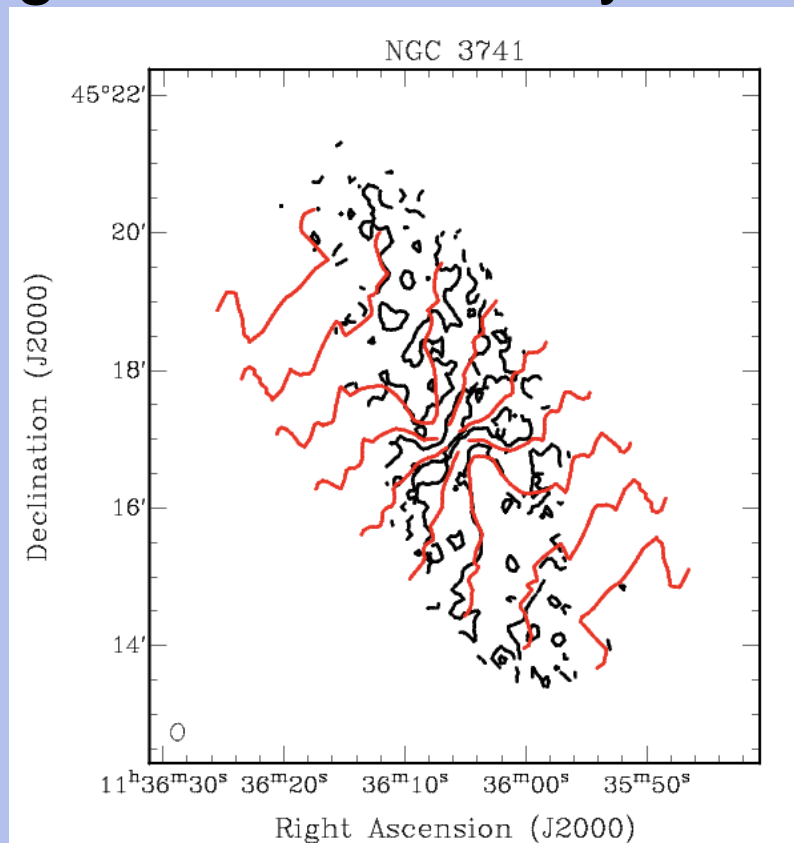

NGC 3741: dwarf irregular galaxy

HI disk extends out to 42 exponential scale lengths (largest ever!)

Very regular/symmetric distribution and kinematics

## Part 2: NGC 3741: kinematics

- First attempt to understand the kinematics:  
tilted-ring fit on the velocity field:

red: model  
black: obs

velocity field

Kinematical and morphological orientations are different!

## Part 2: NGC 3741: kinematics

- First we fixed geometrical parameters to match total HI:

red: model  
black: obs

## Part 2: Non-circular motions

- Then, to determine kinematical parameters:  
harmonic decomposition of the velocity field

(Schoenmakers et al. 1997, Wong, Blitz and Bosma 2004, Gentile et al. 2005)

$$V_{los} = c_0 + \sum_{j=1}^n [c_j \cos(j\psi) + s_j \sin(j\psi)]$$

where  $\psi$ =azimuthal angle and  $c_0=v_{\text{sys}}$

$n=1 \rightarrow$  tilted ring model

$\rightarrow$  Look at  $c_j(r)$  and  $s_j(r)$  terms up to  $j=3$

# Part 2: NGC 3741: kinematics

$c_0$

$c_1/\sin i$

$c_2/\sin i$

$c_3/\sin i$

$s_1/\sin i$

$s_2/\sin i$

$s_3/\sin i$

## Part 2: NGC 3741: kinematics

- Then we built model data cubes, based on physical and geometrical parameters:

centre,  $V_{\text{rot}}(r)$ ,  $V_{\text{rad}}(r)$ ,  $\text{incl}(r)$ ,  $\text{PA}(r)$ , etc.

some are refined iteratively.

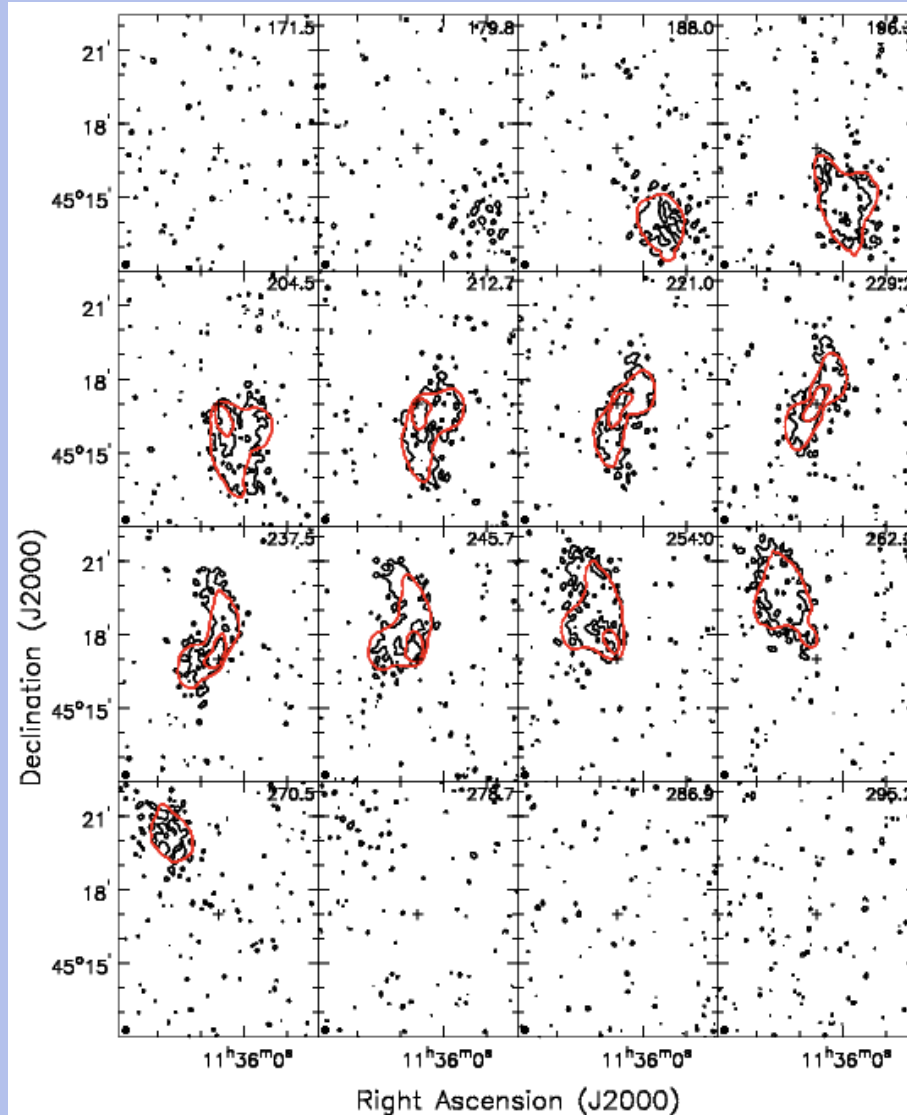

Automatic fitting: work in progress by our group  
(Józsa et al. 2007)

## Part 2: NGC 3741: kinematics

- Very good match of observed and model data cubes:

red: model

black: obs

## Part 2: NGC 3741: kinematics

- How do we interpret these non-circular motions?

$s_3$  vs.  $s_1$  from harmonic decomposition:

inner parts

~anti-correlation

outer parts

no anti-correl.

Speculation: inner bar and outer ongoing accretion?

# Part 2: NGC 3741: mass models

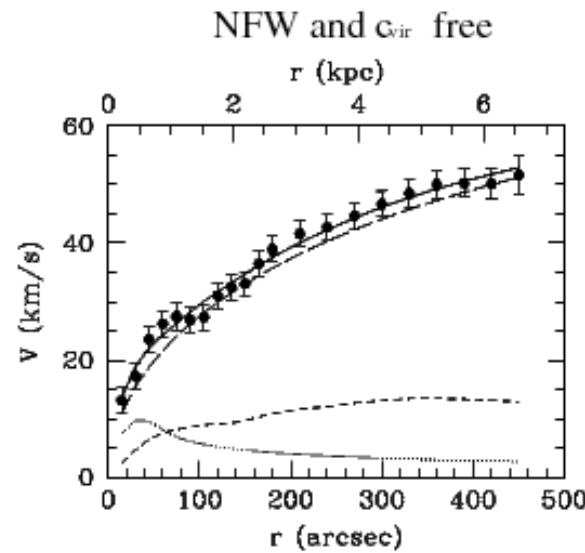

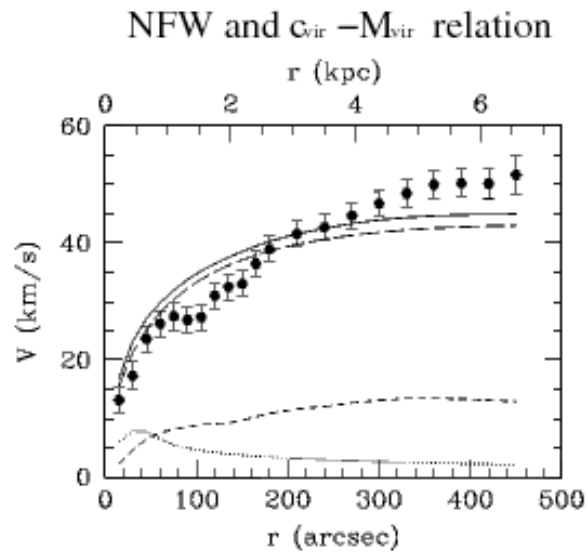

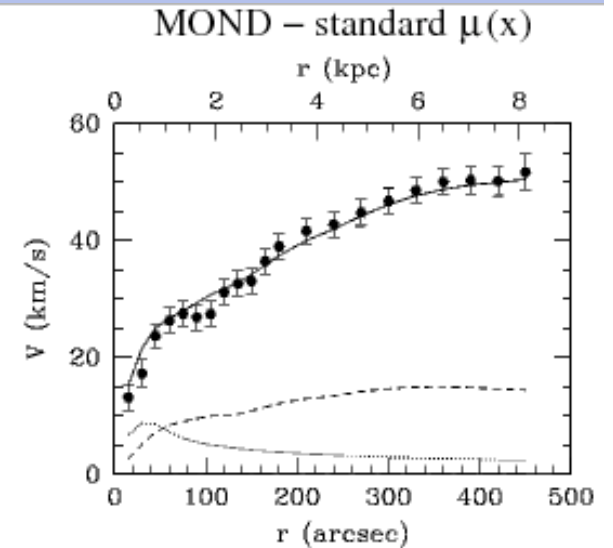

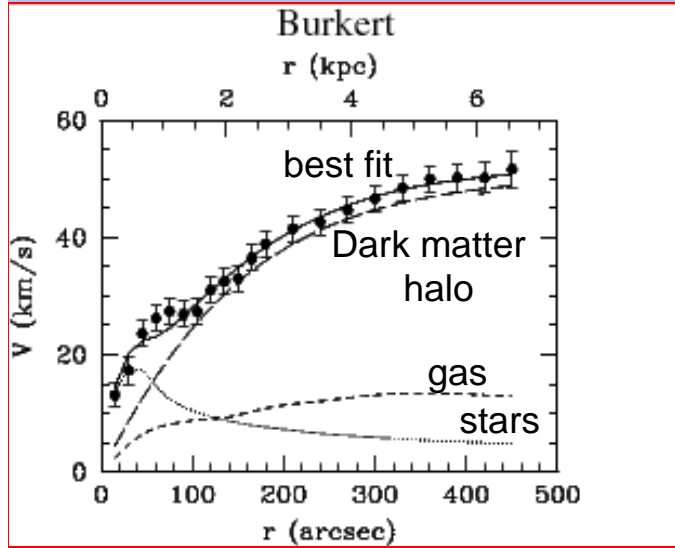

- Burkert halo (central constant density core)
- NFW halo ("cuspy",  $\Lambda$ CDM prediction) using  $c$ - $M_{\text{vir}}$  relation
- NFW halo with  $c$  and  $M_{\text{vir}}$  independent parameters
- Power law ( $\rho \sim r^{-\alpha}$ ):  $\sim$  average slope over observed radial range
- MOND (Modified Newtonian Dynamics)  
with "standard" interpolation function  $\mu(g/a_0)$
- MOND with new  $\mu(g/a_0)$  by Famaey & Binney (2005)

# Part 2: NGC 3741: mass models

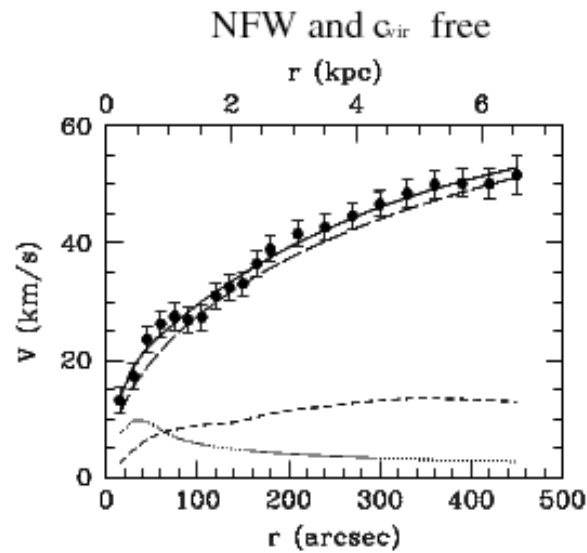

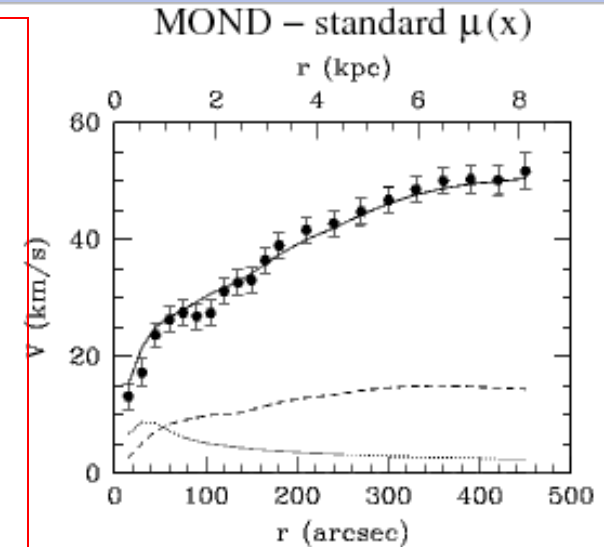

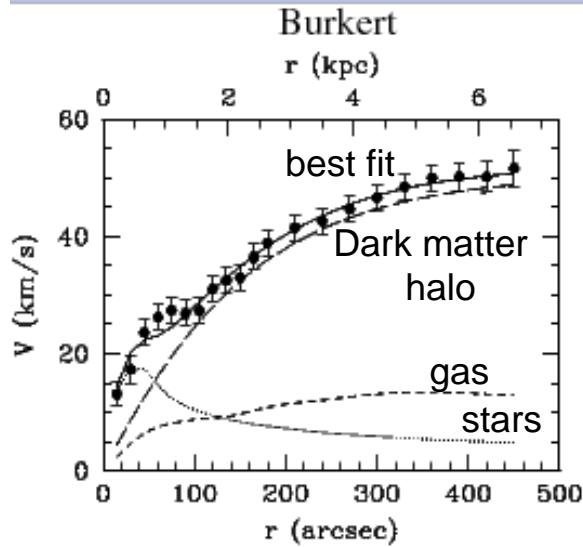

# Part 2: NGC 3741: mass models

Dark matter halo with core fits well

# Part 2: NGC 3741: mass models

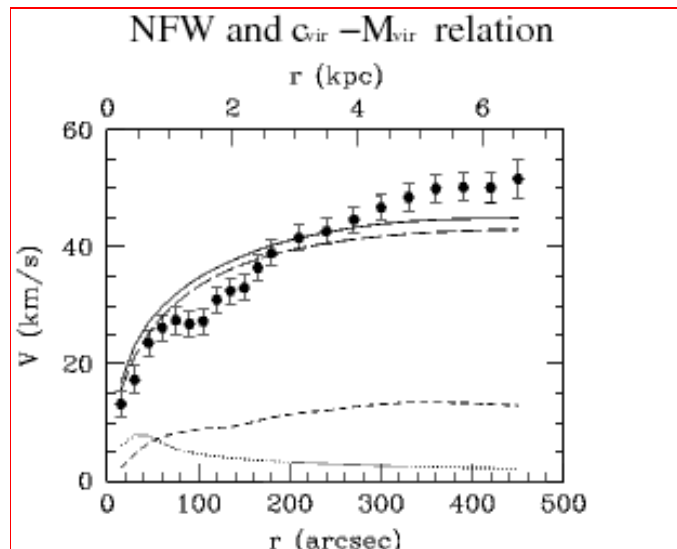

Power-law:  $\rho \sim r^{-\alpha}$ :  $\alpha = 1.1 \pm 0.1 \rightarrow$  Inconsistent with  $\Lambda$ CDM

## Part 2: NGC 3741: mass models

Navarro et al. (2004)

# Part 2: NGC 3741: mass models

NFW using  $c_{vir} - M_{vir}$  relation fits badly

# Part 2: NGC 3741: mass models

$M_{vir} = 10^{11} M_{sol}$ ,  $c_{vir}$  at  $2.5\sigma$  from predicted  $c - M_{vir}$  relation

# Part 2: NGC 3741: mass models

Both MOND fits are very good

# Part 3

Ongoing work

# Gas-rich dwarf galaxies

Sample selection:  $M_{\text{HI}} / L_{\text{B}} > 2.0$

+ other criteria to have good data

(distance, HI flux, dec, inclination, etc.)

Accepted HI proposals:

WSRT: 4 galaxies, each 2 x 12 h - observed in the last few months

VLA: 2 galaxies, 8 h each - observed in March

# UGCA 105

Optical

HI (beam: 15" x 13")

HI data from WSRT

# UGCA 105

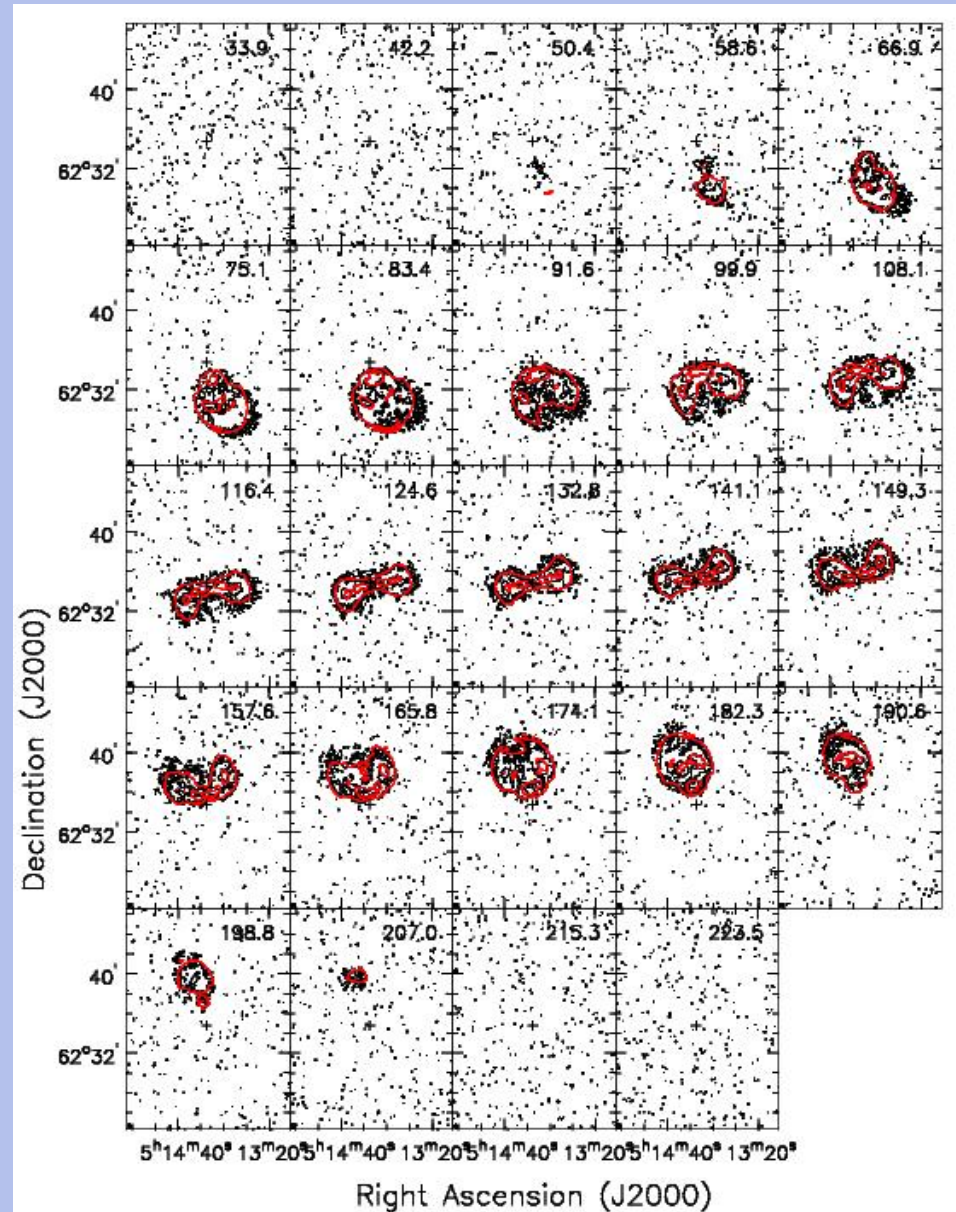

Greyscale: optical - Contours: low-res HI (40"x40")

# UGCA 105 - model data cubes

High resolution

Model data cubes  
using Tirific (Józsa et al. 2007)

<http://www.astro.uni-bonn.de/~gjozsa/tirific.html>

Red: model - Black: observations

# UGCA 105 - model data cubes

Low resolution

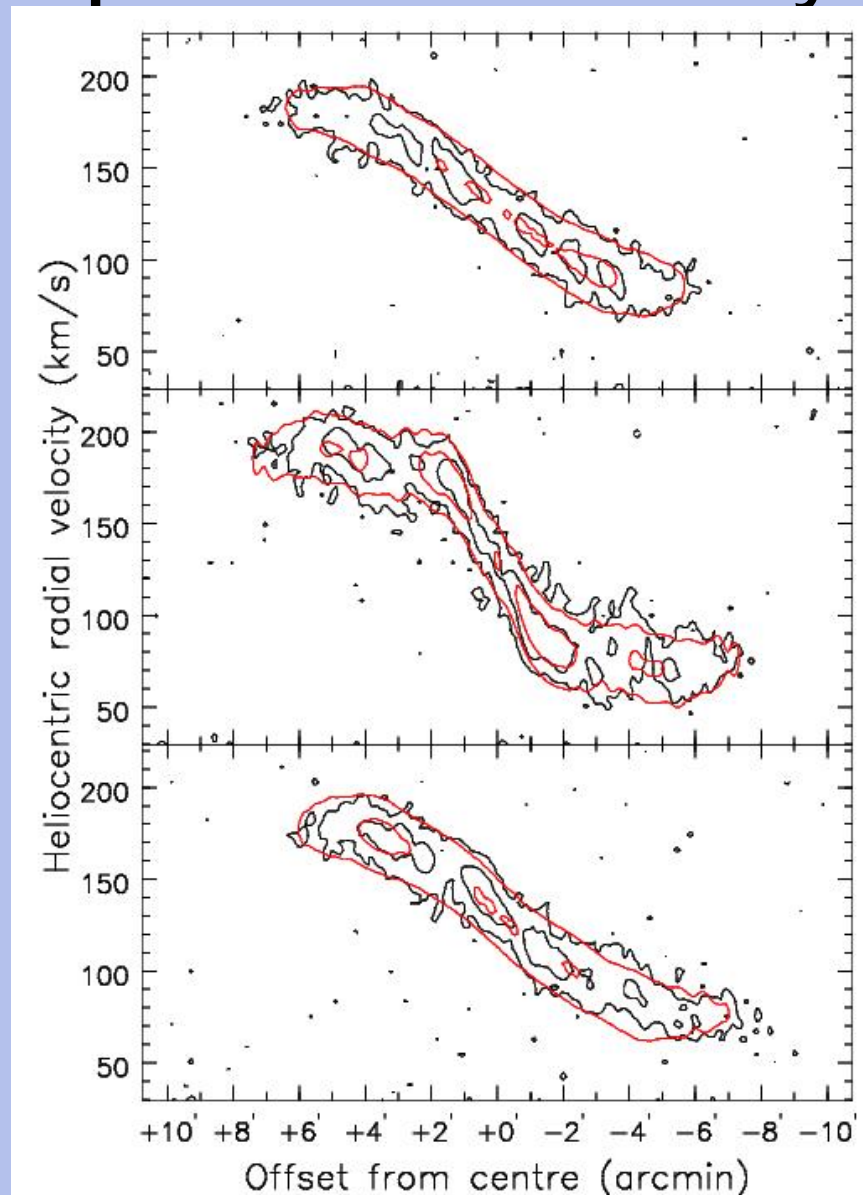

Red: model - Black: observations

# UGCA 105: position-velocity diagrams

High resolution

PVDs parallel  
to major axis

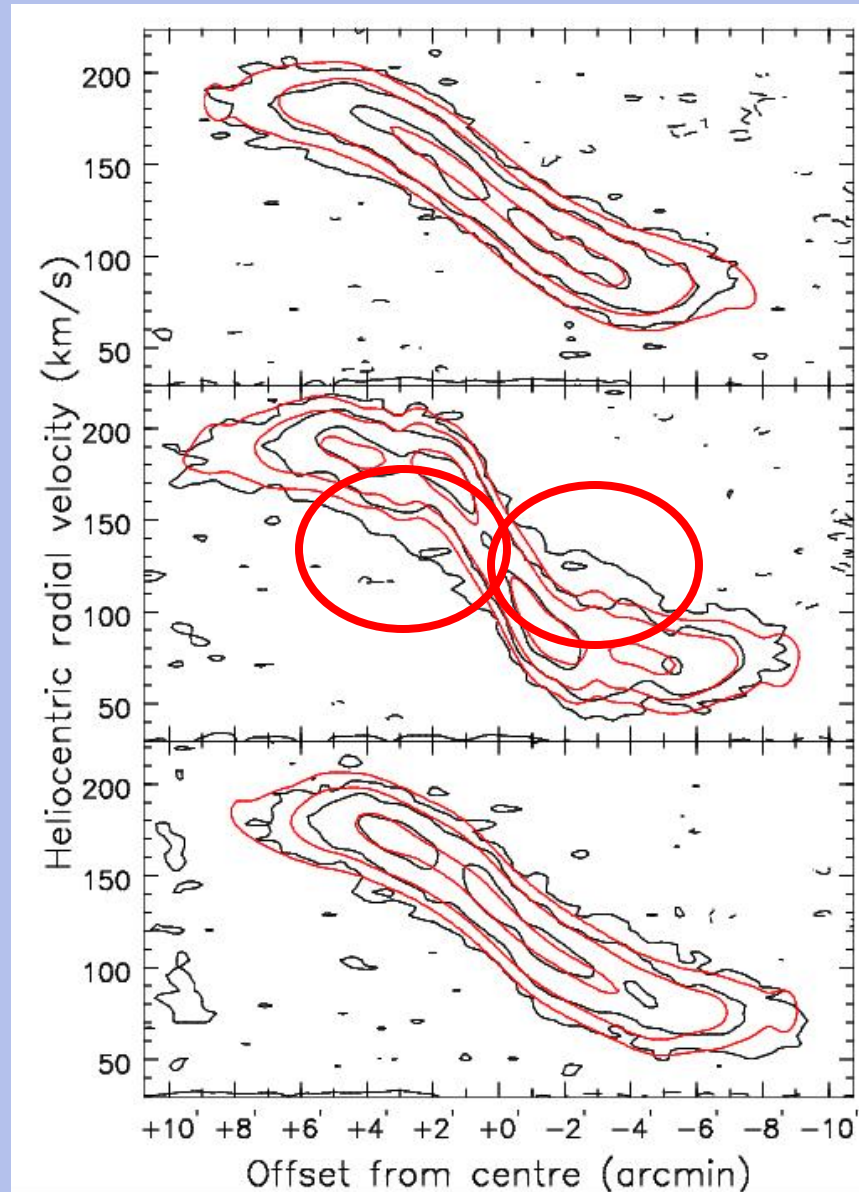

Red: model - Black: observations

# UGCA 105: position-velocity diagrams

Low resolution

PVD parallel  
to major axis

Red: model - Black: observations

# UGCA 105: position-velocity diagrams

Anomalous gas: same signature as in NGC 2403 (Fraternali et al.)

See also works by Heald et al.

# UGCA 105: total HI map

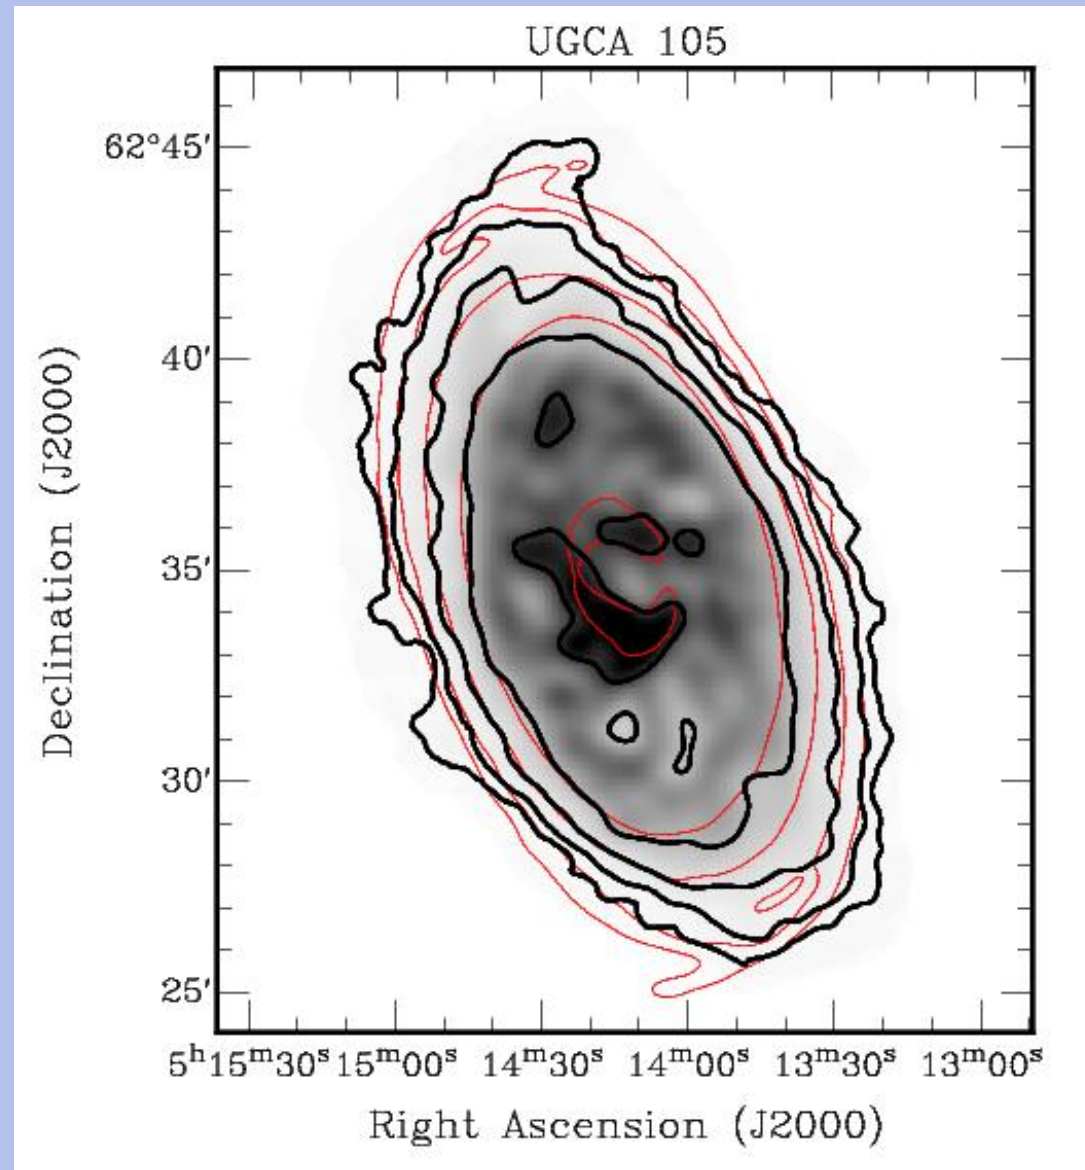

High resolution

Red: model - Black: observations

# UGCA 105: total HI map

Low resolution

Red: model - Black: observations

# UGCA 105: preliminary mass models

Mass model with dark halo  
with constant density core

Mass model with halo  
predicted by  $\Lambda$ CDM

# Part 4: Conclusions

- NGC 3741: - the most extended rotation curve ever
  - HI data: reproduced with model data cubes
  - Cored halo and MOND fit very well
  - NFW fits badly for realistic parameters
- Ongoing work: - sample of NGC 3741-like galaxies (very gas-rich, very large HI disk)
  - currently: UGCA 105, ongoing modelling of WSRT data
